A língua que falamos afeta a forma
como pensamos e percebemos o
mundo?

RELATIVIDADE LINGUÍSTICA

- Hipótese Sapir-Whorf

- **determinismo linguístico:** as características da língua determinam o modo como pensamos, recordamos e percebemos o mundo.
- **relativismo linguístico:** cada língua tem o seu padrão de determinismo - existem tantas estruturas pensamento quantas línguas.

- Versões

- **forte:** a língua determina o pensamento;
- **moderada:** a língua influencia o pensamento, moldando certos aspetos da perceção, da memória ou da atenção.

Edward Sapir (1884 –1939)
Benjamin Lee Whorf (1897-1941)

Language is not only for expression but also helps organise our thought. Diverse languages impose different conceptual categories on their speakers.

LÍNGUAS DO MUNDO

How language shapes the way we think

CORES

CORES

The diagram illustrates the division of color hues in four different languages. It is structured as a table with four rows, each representing a language. The English row shows six distinct color categories: purple, blue, green, yellow, red, and orange. The Shona row shows four categories: cipswuka, citema, cicena, and cipswuka. The Bassa row shows two categories: hui and ziza. The Dani row shows two categories: mili and mola. The colors are represented by a continuous spectrum from purple to orange, with the language-specific terms placed within this spectrum to show their range.

English	purple blue green yellow red orange
Shona	cipswuka citema cicena cipswuka
Bassa	hui ziza
Dani	mili mola

EMPIRICAL STUDY

Active Language Modulates Color Perception in Bilinguals

Akvile Sinkeviciute^{ID},^a Julien Mayor,^b
Mila Dimitrova Vulchanova,^a and Natalia Kartushina^{ID}^b

^aNTNU: Norwegian University of Science and Technology ^bUniversity of Oslo

Abstract: Color terms divide the color spectrum differently across languages. Previous studies have reported that speakers of languages that have different words for light and dark blue (e.g., Russian *siniy* and *goluboy*) discriminate color chips sampled from these two linguistic categories faster than speakers of languages that use one basic color term for blue (e.g., English *blue*). This effect has been reported to be disrupted when participants engaged in a verbal interference task, suggesting that active language use can modulate the linguistic category effect. The current study provided a stringent test of this hypothesis by examining color discrimination under verbal interference in bilinguals speaking Lithuanian (two blue categories) and Norwegian (one blue category). The results revealed that the language activated during verbal interference had a significant impact on bilinguals' color discrimination. Specifically, Lithuanian–Norwegian

Akvile Sinkeviciute: designed the experiments, collected and analyzed the data, and wrote the manuscript. **Julien Mayor:** designed the experiments, analyzed the data, and wrote the manuscript. **Mila Vulchanova:** analyzed the data and wrote the manuscript. **Natalia Kartushina:** designed the experiments, analyzed the data, and wrote the manuscript.

MOMENTO PARA RESPONDER E REFLETIR

(MR²)

A língua que falamos afeta a forma
como pensamos e percebemos o
mundo?

- Sim... mas não no sentido determinista que Whorf imaginava...
- A língua não aprisiona o pensamento — ninguém está condenado a pensar apenas dentro dos limites da sua gramática!
- A língua orienta a atenção, salienta certas dimensões da experiência e habitua-nos a ver o mundo por determinados “filtros”. É como um mapa mental, que cada cultura desenhou ao longo da sua história para organizar o mundo.
- Quando aprendemos uma nova língua, não estamos apenas a aprender novas palavras, estamos a aceder a uma nova forma de ver e categorizar a realidade.
